The right shape to achieve more

Breeding on cue

Cue-Mate® is an intravaginal progesterone delivery device that is used to control the oestrous cycle for synchronisation of oestrous in normally cycling cows, or to induce cycling in anoestrous cows. Cue-Mate® uses a curved, flexible wishbone design with soft pod ends for cow comfort, safety and exceptional device retention. Each device contains 1.56 grams progesterone (each of two replaceable pods contains 0.78 grams progesterone).

Cue-Mate can be purchased as a fully assembled ready-to-use device, or active or blank replacement can be purchased separately to reload devices. Cue-Mate applicators are available separately.

- ✓ Thanks to it's design, Cue-Mate limits device loss from the animals allowing you to **achieve more cycling animals.**
- ✓ The modular design allows you to reuse the wishbone with recharged pods, saving your money and allowing you to **achieve a more rational use of your resources.**
- ✓ For *Bos Indicus* heifers, you can use a one treatment pod (replacing one active with a blank) allowing you to have targeted treatment to **achieve more responding animals.**
- ✓ The Pods have a larger surface area and is in direct contact with the vaginal wall of the animal, delivering the right quantity of progesterone through the device **and acheiving more efficacy.**
